Chapter 12

Quine McCluskey

12.1 Quine-McCluskey PI Table reduction and Petrick's method

This is not in the text-book. For additional reading, please refer to the linked resources on the website.

THE PROBLEM OF SIMPLIFYING TRUTH FUNCTIONS

W. V. QUINE, Harvard University

Minimization of Boolean Functions*

E. J. McCLUSKEY, Jr.

(Manuscript received June 26, 1956)

A systematic procedure is presented for writing a Boolean function as a minimum sum of products. This procedure is a simplification and extension of the method presented by W. V. Quine. Specific attention is given to terms which can be included in the function solely for the designer's convenience.

zyz mplicant

 $\frac{1}{2}$ $\frac{1}{2}$ $\frac{1}{2}$ $\frac{1}{2}$ $\frac{1}{2}$

Definition 12.1 (Implicant). Given a function f of n variables, a product term P is an implicant of f if and only if for every combination of values of the n variables for which P = 1, f is also equal to 1.

Definition 12.2 (Prime Implicant). A prime implicant of a function f is an implicant which is no longer an implicant if \underline{any} literal is removed from it.

There are 4 main steps in the Quine-McCluskey algorithm/PI Table reduction and Petrick's method:

- 1. Generate Prime Implicants
- 2. Construct Prime Implicant Table. PIs as columns, and minterms as rows (don't cares are excluded).
- 3. Reduce Prime Implicant Table by repeating following steps until they it cannot be reduced further
 - (a) Remove Essential Prime Implicants

wernt am

piggalym

- (b) Row Dominance: Remove dominating rows. (i.e. unnecessary minterms)
- (c) Column Dominance: Remove dominated columns. (i.e. remove unnecessary PIs)
- 4. Solve Prime Implicant Table by Petrick's method

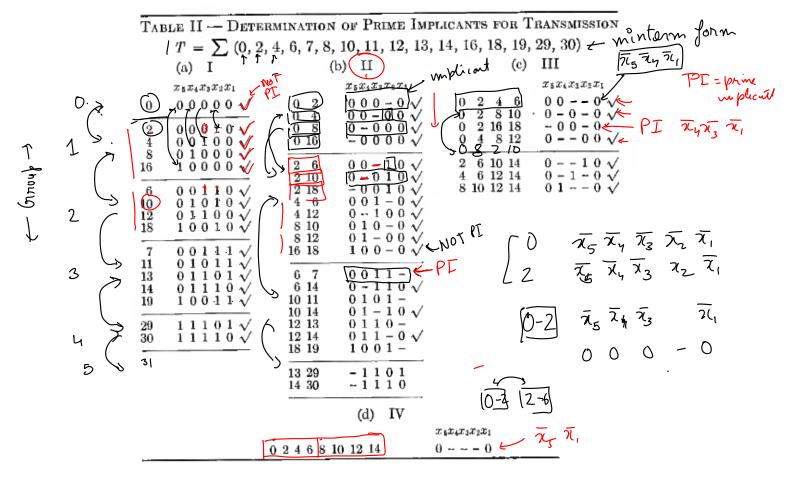

12.1.1 Generate Prime Implicants

Example 12.1. Generate prime implicants of the function

$$\begin{array}{l} {\mathcal{X}_{51}} \, {\mathcal{X}_{41}} \, {\mathcal{X}_{33}} \, {\mathcal{X}_{23}} \, {\mathcal{X}_{1}} \\ F(\underline{A,B,C,D}) &= \sum m(0,2,4,6,7,8,10,12,13,14,16,18,19,29,3\underline{0}) \end{array}$$

 $using\ Quine-McCluskey\ method$

Steps:

- 1. Start with writing minterms in binary format (include don't cares as minterms).
- 2. Create potential groups of minterms that can be combined (merged). The only minterms that can be combined differ only be single 1. Create a new list of combined minterms as n-1 literal implicants.
- 3. Check off the minterms that could be combined. Unchecked minterms are prime implicants (PIs).
- 4. Repeat the grouping process with n-1 literal implicants.

12.1.2 Prime Implicants table and reduction

Example 12.2. Reduce the prime implicants $\{\bar{B}\bar{D},C\bar{D},BD,BC,A\bar{D},AB\}$ using prime implicants table.

How to find the smallest set of PIs that cover all the minterms

- 1. PI table reduction
- 2. Petrick's method

Example 12.3.

CD A	B 00	01	11	10
00	1		0	0
01	0	1	1	0
11	0	0	1	1
10	0	0	0	0

Example 12.4.

CD A	B 00	01	11	10
00	d	0	0	0
01	1	1	d	d
11	1	1	0	0
10	1	d	0	0
